Altered Flood Control, Climate Change, and Rebuilding Pacific Northwest Salmon Stocks

Kyle Dittmer

Hydrologist – Meteorologist

March 24, 2006

Columbia River Inter-Tribal Fish Commission

Portland, Oregon
Introduction

- A Natural River reservoir operation promotes environmental conditions that are in harmony with the salmon’s biological timing. (Return of the River...Independent Science Group, 2000, http://www.nwcouncil.org/library/return/2000-12.htm)

- Altered flood control and earlier reservoir refill can create a more natural flow regime.

- Modified operations are at Grand Coulee (WA), Dworshak (ID), Brownlee (ID), Libby & Hungry Horse (MT), Mica & Arrow (British Columbia).
Natural Flow regime Concept

- Natural Flow improves salmon survival with: increased turbidity & habitat, decreased travel time, higher river and estuary productivity.
- Altered Flood Control uses less reservoir drafts during winter and early spring.
- More water is shifted from winter to spring.
- Summer flow augmentation: 3.377 MaF.
- Nez Perce Tribe Summer Plan for Dworshak.
- Modified VAR-Q used for Libby & Hungry Horse.
GENESYS Hydro-generation model

• This NPPC model uses monthly time steps.
• Operations are specified at major PNW dams.
• Model runs sequentially from dam-to-dam.
• Record spans 50 Water Years: 1929 - 1978.
• Output: flow, spill, pool elevations, generation.
• Rule Curves altered for flood control operations.
• In 2006 (?), model upgrades: 70 water years (1929-1999) and maybe half-month time steps.

Corps System Flood Control

- Regulate Flood of 1894 to 800 kcfs (primary) and 600 kcfs (secondary), at The Dalles.
- Flood flow, 550 kcfs; and Bank-full, 450 kcfs.
- Reservoirs systematically drawn down from January through April 30.
- Reservoir draft depends on monthly final Water Supply (Volume) Forecast. Corps does not look at trend of WSF and may overdraft reservoirs.
- Reservoirs start refilling after May 1st.
- Reservoirs fill by June 30th and pass inflow.
Long-term Effects of Corps Flood Control

FIGURE 2  Average daily river flows measured at The Dalles, Oregon over the historical record and construction dates of Columbia basin mainstem hydroprojects. From PFC* (1992).
Altered Flood Control

- Global warming will reduce winter snow packs. Spring flood control drafts can be reduced.
- New forecast tools (eg, UW, NOAA, CRITFC) can reduce premature flood control drafts.
- Fill all reservoirs by May 31st, not June 30th.
- Inflows passed in June for a higher spring peak.
- Altered Flood Control adds more storage: 508 KaF at Grand Coulee, 874 KaF at Libby, 366 KaF Hungry Horse, 420 KaF at Dworshak, 205 KaF at Brownlee, 507 KaF from Mica and Arrow. Total = 2.9 MaF.
Each year on average, CRITFC’s Altered Flood Control can shift the entire volume of Dworshak and Brownlee reservoirs to benefit salmon passage!!!

Results of Natural Peak River plan using GENESYS model

• About 2.9 MaF more water per year is flushed. Average June peak at The Dalles is 327 kcfs. High water year peak is 417 kcfs (13 years). Low water year peak is 220 kcfs (11 years).

• McNary spring flows increase by 7% and summer flows increase by 5%.

• Residence times increase at DWR, HGH, LIB.

• Generation increases in summer, less in winter. Annual generation: 154,600 MW (6383 MW less than 2000 Biological Opinion)

Benefits to Northwest Salmon

- Enhanced ecosystem health and diversity. Resident fish populations enjoy more habitat.
- Speed juvenile migrants to the estuary.
- Transport more woody and organic debris.
- Less predation. Cooler passage water.
- Increase estuary plume--critical habitat.
- Provide adequate flow for returning adults.
- Re-connect and reactivate flood-plain habitats.
How a Natural River plan may Impact the Pacific Northwest

• More salmon return to spawn while Columbia Tribal treaties are honored.

• Flood risk to Portland: 16% vs. 14% (Federal) vs. 42% (historic). Bank-full flow: 50% risk versus 42% (Federal) vs. 64% (historic).

• Spring flood risk is offset by global warming.

• Less winter time wind erosion on the banks of Lake Roosevelt (WA).

• Less sediment sloughing in affected reservoirs.

Summary

• Altered flood control can offer 2.9 MaF of extra flow to benefit salmon stocks while move the Columbia and Snake Rivers back to a natural flow pattern, have reasonable flood protection, and take advantage of global warming.

• Natural River plan shifts winter flow into spring, refills dams by May 31, and pass inflow in June. Flood risk increases from 14% to 16% but will decrease as global climate warming continues.

• Next step: Daily flood risk & life-cycle studies.
